

FLEXEND™

Vibration reduction

flexicoil
SETTING THE STANDARD

The **FLEXEND 25M** has been designed and developed to fit air drills that have a “hose in” system.

This is when the Air drill hose is clamped into the secondary spreader heads like the John Deere and Flexicoil air kit systems.

The plastic that the FLEXENDS are made from are extremely tough and hard wearing yet flexible and reduce the damage to hoses.

This also stops the hoses from coming loose and falling out of the heads whilst reducing the damage to the hose from vibration in the cold.

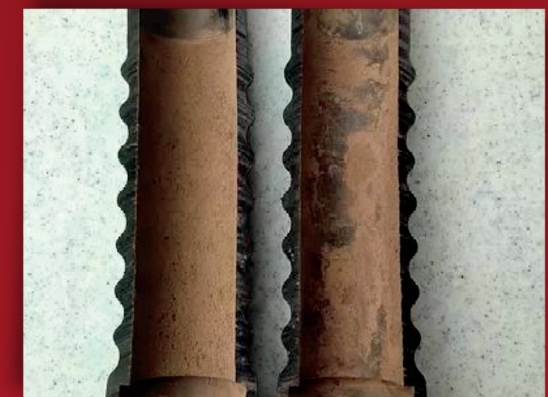

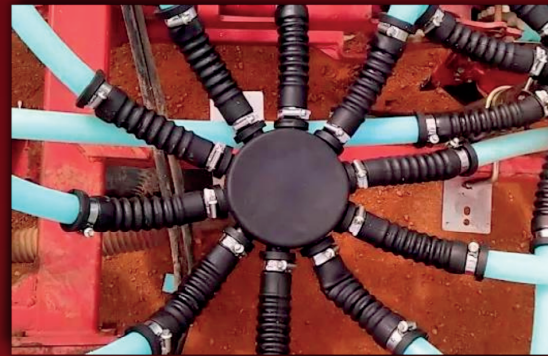

This model is only available in 25mm

NITRO-CLIP™™

NITRO-CLIP USED ON STANDARD AIR SEEDER HOSE.

NITRO-CLIP is a specially designed clip to hold the liquid fertiliser tube neatly and securely to the air seeder hose. The **NITRO-CLIP** will save you time when installing the liquid fertiliser system or if you are trying to repair or fix your current system.

- **NITRO-CLIP** has 3 clips to hold both 5mm and 6mm flow control hose.
- **NITRO-CLIP** will fit all secondary airseeder hose up to 46mm O.D.
- The **NITRO-CLIP** has 4 grippers on the inside to stop it from sliding or twisting on the tubes.

First push the liquid line into the **NITROCLIP**

Then open the **NITROCLIP** to put over the hose. Try not to move the clip after it has gripped the hose to let the grippers work.

NITRO-CLIP USED IN ROUGH OR TIGHT AREAS.

NITRO-CLIP has a specially added side sleeve so that a hose clamp can be applied to stop it from coming off.

NITRO-CLIP can be used low to the ground near the sowing boot and it will not be knocked off with trash or mud clumps hitting it.

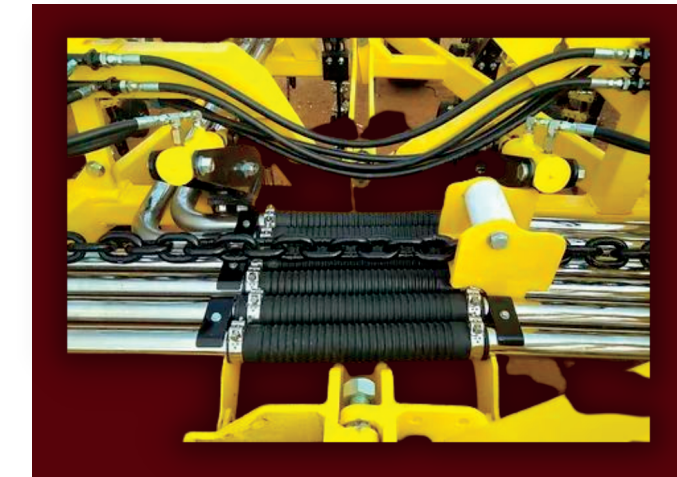

Here you can see them being installed on LDPE air seeder hose and PVC with nylon bound hose.
